## Convex bodies and lattice polytopes

A convex body:

## Convex bodies and lattice polytopes

A convex body:
A lattice polytope:

## Convex bodies and lattice polytopes

A convex body:

A lattice polytope:

A convex body or lattice polytope is hollow (or lattice-free) if there are no lattice points in its interior.

## Width

Given $K$ a convex body in $\mathbb{R}^{d}$; and $\mathbb{Z}^{d} \cong \Lambda \subset \mathbb{R}^{d}$ a lattice,

## Width

Given $K$ a convex body in $\mathbb{R}^{d}$; and $\mathbb{Z}^{d} \cong \Lambda \subset \mathbb{R}^{d}$ a lattice,

## Definition

- The width of $K$ w.r.t. a functional $f \in\left(\mathbb{R}^{d}\right)^{*}$ is $\max _{p \in K} f(p)-\min _{p \in K} f(p)$.

## Width

Given $K$ a convex body in $\mathbb{R}^{d}$; and $\mathbb{Z}^{d} \cong \Lambda \subset \mathbb{R}^{d}$ a lattice,

## Definition

- The width of $K$ w.r.t. a functional $f \in\left(\mathbb{R}^{d}\right)^{*}$ is $\max _{p \in K} f(p)-\min _{p \in K} f(p)$. Equivalently, it is the length of $f(K)$.

## Width

Given $K$ a convex body in $\mathbb{R}^{d}$; and $\mathbb{Z}^{d} \cong \Lambda \subset \mathbb{R}^{d}$ a lattice,

## Definition

- The width of $K$ w.r.t. a functional $f \in\left(\mathbb{R}^{d}\right)^{*}$ is $\max _{p \in K} f(p)-\min _{p \in K} f(p)$. Equivalently, it is the length of $f(K)$.
- The (lattice) width of $K$ is the minimum width w.r.t. functionals in $\Lambda^{*} \backslash 0$. We denote it width $_{\Lambda}(K)$.

## Width

Given $K$ a convex body in $\mathbb{R}^{d}$; and $\mathbb{Z}^{d} \cong \Lambda \subset \mathbb{R}^{d}$ a lattice,

## Definition

- The width of $K$ w.r.t. a functional $f \in\left(\mathbb{R}^{d}\right)^{*}$ is $\max _{p \in K} f(p)-\min _{p \in K} f(p)$. Equivalently, it is the length of $f(K)$.
- The (lattice) width of $K$ is the minimum width w.r.t. functionals in $\Lambda^{*} \backslash 0$. We denote it width $_{\Lambda}(K)$.

## Flatness theorem

Theorem (Flatness, Kinchine 1948)
If $K \subset \mathbb{R}^{d}$ is a hollow convex body, then its width is bounded by a constant $w_{c}(d)$.

## Flatness theorem

Theorem (Flatness, Kinchine 1948)
If $K \subset \mathbb{R}^{d}$ is a hollow convex body, then its width is bounded by a constant $w_{c}(d)$.

Upper bounds for $w_{c}(d)$ are well studied, because of applications in integer linear programming.

## Flatness theorem

Theorem (Flatness, Kinchine 1948)
If $K \subset \mathbb{R}^{d}$ is a hollow convex body, then its width is bounded by a constant $w_{c}(d)$.

Upper bounds for $w_{c}(d)$ are well studied, because of applications in integer linear programming.

Our goal: improve lower bounds on the flatness constant, that is, construct hollow convex bodies/polytopes of large width.

## Variations on flatness constants

We denote $w_{c}(d), w_{p}(d), w_{s}(d)$ the maximum width among hollow convex bodies, lattice polytopes, and lattice simplices.

## Variations on flatness constants

We denote $w_{c}(d), w_{p}(d), w_{s}(d)$ the maximum width among hollow convex bodies, lattice polytopes, and lattice simplices.
Some facts to start with:

$$
w_{s}(d) \leq w_{p}(d) \leq w_{c}(d)
$$

## Variations on flatness constants

We denote $w_{c}(d), w_{p}(d), w_{s}(d)$ the maximum width among hollow convex bodies, lattice polytopes, and lattice simplices.
Some facts to start with:

$$
d \leq w_{s}(d) \leq w_{p}(d) \leq w_{c}(d)
$$

## Variations on flatness constants

## $w_{c}(2):$ Hurkens' construction

## $w_{c}(2):$ Hurkens' construction

Lattice triangle circumscribed around $A B C$; only lattice triangle of width 2.

## $w_{c}(2):$ Hurkens' construction

This triangle, also circumscribed around $A B C$, has lattice width $1+\frac{2}{\sqrt{3}}$.

## $w_{c}(2):$ Hurkens' construction

This triangle, also circumscribed around $A B C$, has lattice width $1+\frac{2}{\sqrt{3}}$.

## Theorem (Hurkens 1990)

This triangle has the largest lattice width of any hollow convex body in $\mathbb{R}^{2}$; that is, $w_{c}(2)=1+\frac{2}{\sqrt{3}}$.

## $w_{c}(3):$ A wide tetrahedron

In the (affine) lattice $\{(a, b, c): a, b, c \in 1+2 \mathbb{Z}, a+b+c \in 1+4 \mathbb{Z}\}$,

$$
\begin{gathered}
T=\operatorname{conv}\{(-1,1,1),(-1,-1,-1), \\
(1,-1,1),(1,1,-1)\}
\end{gathered}
$$

is a unimodular tetrahedron.

## $w_{c}(3)$ : A wide tetrahedron

In the (affine) lattice $\{(a, b, c): a, b, c \in 1+2 \mathbb{Z}, a+b+c \in 1+4 \mathbb{Z}\}$,

Figure: $\Delta_{0}$

$$
\begin{array}{r}
T=\operatorname{conv}\{(-1,1,1),(-1,-1,-1) \\
(1,-1,1),(1,1,-1)\}
\end{array}
$$

is a unimodular tetrahedron.
$\Delta_{0}$ is the lattice tetrahedron circumscribed to $T$ with vertices

$$
\begin{aligned}
& A=(3,1,5), \\
& B=(-1,3,-5), \\
& C=(-3,-1,5), \\
& D=(1,-3,-5) .
\end{aligned}
$$

It has width 3.

## $w_{c}(3)$ : A wide tetrahedron

Figure: $\Delta$ has width $2+\sqrt{2}$

## $w_{c}(3)$ : A wide tetrahedron

We can modify $\Delta_{0}$ to a tetrahedron $\Delta$ of width $2+\sqrt{2}$.
Thus,
Corollary (C.-Santos, 2018+)
$w_{c}(3) \geq 2+\sqrt{2}$.

## Conjecture

This is the hollow 3-body of maximum width. That is, $w_{c}(3)=2+\sqrt{2}$.
Figure: $\Delta$ has width $2+\sqrt{2}$

## Interlude: Direct sum of convex bodies

## Definition

Let $C_{i} \subset \mathbb{R}^{d_{i}}$ be convex bodies containing the origin. Their direct sum is the following convex body in $\mathbb{R}^{d_{1}+\cdots+d_{m}}$ :

$$
\begin{aligned}
& C_{1} \oplus \cdots \oplus C_{m}= \\
& =\operatorname{conv}\left(\bigcup_{i=1}^{m}\left(0 \times \cdots \times 0 \times C_{i} \times 0 \times \cdots \times 0\right)\right) \\
& =\left\{\left(\lambda_{1} x_{1}, \ldots, \lambda_{m} x_{m}\right): x_{i} \in C_{i}, \lambda_{i} \geq 0, \sum_{i=1}^{m} \lambda_{i}=1\right\}
\end{aligned}
$$

## Interlude: Direct sum of convex bodies

## Definition

Let $C_{i} \subset \mathbb{R}^{d_{i}}$ be convex bodies containing the origin. Their direct sum is the following convex body in $\mathbb{R}^{d_{1}+\cdots+d_{m}}$ :

$$
\begin{aligned}
& C_{1} \oplus \cdots \oplus C_{m}= \\
& =\operatorname{conv}\left(\bigcup_{i=1}^{m}\left(0 \times \cdots \times 0 \times C_{i} \times 0 \times \cdots \times 0\right)\right) \\
& =\left\{\left(\lambda_{1} x_{1}, \ldots, \lambda_{m} x_{m}\right): x_{i} \in C_{i}, \lambda_{i} \geq 0, \sum_{i=1}^{m} \lambda_{i}=1\right\}
\end{aligned}
$$

## Interlude: Direct sum of convex bodies

## Definition

Let $C_{i} \subset \mathbb{R}^{d_{i}}$ be convex bodies containing the origin. Their direct sum is the following convex body in $\mathbb{R}^{d_{1}+\cdots+d_{m}}$ :

$$
\begin{aligned}
& C_{1} \oplus \cdots \oplus C_{m}= \\
& =\operatorname{conv}\left(\bigcup_{i=1}^{m}\left(0 \times \cdots \times 0 \times C_{i} \times 0 \times \cdots \times 0\right)\right) \\
& =\left\{\left(\lambda_{1} x_{1}, \ldots, \lambda_{m} x_{m}\right): x_{i} \in C_{i}, \lambda_{i} \geq 0, \sum_{i=1}^{m} \lambda_{i}=1\right\}
\end{aligned}
$$

## Interlude: Properties of the direct sum

It's easy to compute the width of direct sums:

$$
\text { width }\left(C_{1} \oplus \cdots \oplus C_{m}\right)=\min _{i} \text { width }\left(C_{i}\right)
$$

## Interlude: Properties of the direct sum

It's easy to compute the width of direct sums:

$$
\text { width }\left(C_{1} \oplus \cdots \oplus C_{m}\right)=\min _{i} \text { width }\left(C_{i}\right)
$$

and to observe that if all summands are lattice polytopes, so is the sum.

## Interlude: Properties of the direct sum

It's easy to compute the width of direct sums:

$$
\text { width }\left(C_{1} \oplus \cdots \oplus C_{m}\right)=\min _{i} \text { width }\left(C_{i}\right)
$$

and to observe that if all summands are lattice polytopes, so is the sum.
Regarding hollowness:
Lemma ((special case of) Averkov-Basu 2015)
If $C$ is hollow, then $\bigoplus_{i=1}^{m} m C$ is hollow of width $m \cdot$ width $(C)$.

## $w_{p}(14)$ : A lattice polytope of large width

Hurkens' triangle, circumscribed to the unimodular triangle $A B C$

## $w_{p}(14):$ A lattice polytope of large width

We refine the lattice, in black we have $\Lambda^{\prime}=\frac{1}{7} \Lambda$

## $w_{p}(14)$ : A lattice polytope of large width

Hurkens' triangle has a nice rational approximation $T$ of width $15 / 7=$ 2.1429.

## $w_{p}(14)$ : A lattice polytope of large width

Hurkens' triangle has a nice rational approximation $T$ of width $15 / 7=$ 2.1429.

From the direct sum construction, with summands equal to $7 T$, follows

## Corollary (C.-Santos 2018+)

There is a 14-dimensional hollow lattice polytope of width 15 . It has 21 vertices and $2^{7}+7$ facets.

## $w_{s}(404)$ : A lattice simplex of large width

Regarding lattice simplices, we can prove the following:

## Lemma

There is a rational hollow 4-simplex of width $4\left(1+\frac{1}{101}\right)$.
This is obtained by "pushing out" a facet of a known empty lattice 4-simplex of width 4.

## $w_{s}(404):$ A lattice simplex of large width

Regarding lattice simplices, we can prove the following:

## Lemma

There is a rational hollow 4-simplex of width $4\left(1+\frac{1}{101}\right)$.
This is obtained by "pushing out" a facet of a known empty lattice 4 -simplex of width 4. From the direct sum construction, we obtain

## Corollary (C.-Santos 2018+)

There is a hollow 404-simplex of width 408.

## Asymptotics of $w_{c}, w_{p}$ and $w_{s}$

We also apply the direct sum construction to obtain asymptotics of our constants. In particular,

Theorem ((Codenotti-S. 2018+))

$$
\begin{aligned}
& \lim _{d \rightarrow \infty} \frac{w_{p}(d)}{d}=\lim _{d \rightarrow \infty} \frac{w_{c}(d)}{d}=\sup _{d \rightarrow \infty} \frac{w_{c}(d)}{d} \geq \frac{2+\sqrt{2}}{3}=1.138 \ldots, \\
& \lim _{d \rightarrow \infty} \frac{w_{s}(d)}{d} \geq \frac{102}{101}=1.0099 \ldots
\end{aligned}
$$

where on the right we have used $w_{c}(3) / 3 \geq \frac{2+\sqrt{2}}{3}$, based on the tetrahedron of width $2+\sqrt{2}$, and $w_{s}(404) / 404 \geq \frac{102}{101}$ from the 404-dimensional simplex.

## Thank you for your attention!

Giulia Codenotti, Francisco Santos. Hollow polytopes of large width. Preprint, 17 pages, December 2018.
