## Statistical Models

## Part 1

## Hierarchical Models

- record the dependency relationships of random variables

## Applications

|  |  |  | Type of Infection |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Varicella | Influenza | Gastroenteritis |
| Use Aspirin | Yes | 29 | 21 | 2 |
| regularly | No | 704 | 188 | 125 |
|  |  |  |  |  |

Data on the use of Aspirin from 1070 patients with Reye's Syndrome in US from 1980 to 1997.

Question: Among patients with Reye's syndrome, is there any relation between the type of infection and the use of Aspirin to treat that infection?

## Running Example

- $\Omega_{1}=\{$ Varicella, Influenza, Gastroenteritis $\} \quad \mathrm{r}_{1}=3$
- $\Omega_{2}=\{$ Use Aspirin reg., Don't use Aspirin reg. $\} \quad \mathrm{r}_{2}=2$
- $\left(Z_{1}, Z_{2}\right) \in \Omega_{1} \times \Omega_{2}$
- $P\left(Z_{1}=i, Z_{2}=j\right)=p_{i, j}$
- $\mathcal{P}=\left\{\left(p_{i, j}\right) \mid(i, j) \in \Omega_{1} \times \Omega_{2}, \sum_{i, j} p_{i, j}=1\right\}$

$$
\mathrm{M}_{1}=\left\{\left(p_{i, j}\right) \in \mathcal{P} \mid p_{i, j}=p_{i, \bullet} \cdot p_{\bullet, j}, \text { for all }(i, j) \in \Omega_{1} \times \Omega_{2}\right\}
$$

$$
\mathrm{M}_{2}=\mathcal{P} / M_{1}
$$

## Running Example

## Visualizations of the Models

$$
\mathrm{M}_{1}=\left\{\left(p_{i, j}\right) \mid p_{i, j}=p_{i, \bullet} \cdot p_{\bullet}, j\right\} \quad \mathrm{M}_{2}=\mathcal{P} / \mathcal{M}_{1}
$$

$r_{1}$
$r_{2}$

## Analyzing Data

- $\Omega_{1}=\{$ Varicella, Influenza, Gastroenteritis $\} \quad \mathrm{r}_{1}=3$
- $\Omega_{2}=\{$ Use Aspirin reg., Don't use Aspirin reg. $\} \quad \mathrm{r}_{2}=2$
- $\Omega_{3}=\{$ children, teenagers $\} \quad \mathrm{r}_{3}=2$

Choose the model that best fits the data.

## Hierarchical Models

## Definition

A hierarchical model $\mathcal{M}$ on $m$ randon variables consists of
(1) a vector $\mathbf{r}=\left(r_{1}, r_{2}, \cdots, r_{m}\right)$, where each $r_{i}$ denotes the number of states for the variable $Z_{i}$.
(2) a collection $\Delta=\left\{F_{1}, F_{2}, \cdots, F_{n}\right\}$, where each $F_{j} \subset[m]$ in the collection encodes a maximal non independent relation among the parameters indicated in it.

$$
\mathcal{M}(\mathbf{r}, \Delta)=\left\{\left(p_{i_{1} \ldots i_{m}}\right) \mid p_{i_{1}, \ldots, i_{m}}=\prod_{F \in \Delta} p_{\mathbf{i}_{F}} \text { for all }\left(i_{1} \ldots i_{m}\right) \in \prod_{k \in[m]}\left[r_{k}\right]\right\}
$$

## How to choose the right model?

## Part 2

## Ideals of Hierarchical Models in Algebra

## Constructing the Ideal

$$
\begin{aligned}
\mathbb{K}\left[X_{111}, X_{112} \ldots X_{322}\right] & \xrightarrow{\mathbb{K}}\left[Y_{11} \ldots Y_{32}, Z_{11} \ldots Z_{32}\right], \\
X_{i j k} & \longmapsto Y_{i j} \cdot Z_{i k}
\end{aligned}
$$

$\mathcal{M}[(3,2,2),\{\{1,2\},\{1,3\}\}]$

$$
I=\operatorname{ker}(\phi) \text { is the ideal for } \mathcal{M}
$$

$$
\begin{gathered}
I=<X_{111} X_{122}-X_{112} X_{121}, \\
X_{211} X_{222}-X_{212} X_{221}, \\
X_{311} X_{322}-X_{312} X_{321}>
\end{gathered}
$$

## General Construction

Let $\mathcal{M}(\mathbf{r}, \Delta)$ be a hierarchical model.

$$
\begin{aligned}
& \mathbb{K}\left[X_{i_{1} \ldots i_{m}} \mid\left(i_{1}, \ldots i_{m}\right) \in \prod_{i \in[m]}\left[r_{i}\right]\right] \xrightarrow{\phi} \mathbb{K}\left[Y_{F, \mathbf{j}_{F}} \mid F \in \Delta, \quad \mathbf{j}_{F} \in \prod_{i \in F}\left[r_{i}\right]\right] \\
& \mathrm{X}_{\mathbf{i}} \longmapsto \prod_{F \in \Delta} Y_{F, \mathbf{i}_{F}}
\end{aligned}
$$

$$
\text { Note: }\left[r_{i}\right]=\left\{1,2, \ldots, r_{i}\right\}
$$

$$
I=\operatorname{ker}(\phi) \text { is the ideal for } \mathcal{M}
$$

$$
I=<\left\{\overline{\mathrm{x}}^{\mathbf{u}}-\overline{\mathrm{x}}^{\mathbf{v}}\right\}>
$$

## Fundamental Theorem of Markov Bases [Diaconis-Sturmfels, 1998]

A subset $\beta \subset k e r_{\mathbb{Z}} A$ is a Markov Basis for $\mathcal{M}$ if and only if the corresponding set of binomials $\left\{\overline{\mathrm{x}}^{b^{+}}-\overline{\mathrm{x}}^{b^{-}} \mid b=b^{+}-b^{-} \in \beta\right\}$ generates the ideal $I$.
Note: $b^{+}$and $b^{-}$are respectively positive and negative part of the vector $b$.

## Part 3

## Quantitative Properties of the Ideals

Let $R$ be a graded polynomial ring in finitely many variables over a field $\mathbb{K}$ and $I$ a homogeneous ideal in $R$.

$$
R / I=[R / I]_{0} \oplus[R / I]_{1} \oplus \cdots \oplus[R / I]_{d} \oplus \ldots
$$

where $[R / I]_{d}=\{$ all homogeneous polynomials of degree $d$ in $R / I\}$

$$
\mathrm{H}_{R / I}(t)=\sum_{d \geq 0} \operatorname{dim}_{\mathbb{K}}[R / I]_{d} \cdot t^{d}
$$

Hilbert series are rational of the form

$$
H_{R / I}(t)=\frac{g(t)}{(1-t)^{\operatorname{dim} R / I}}, \quad g(t) \in \mathbb{Z}[t], g(1) \neq 0
$$

## Continuing our example

$$
\begin{aligned}
& r_{1}=3 \quad r_{2}=2 \\
& \bigcirc \quad \circ \\
& \mathcal{M}((3,2),\{\{1\},\{2\}\}) \\
& \begin{aligned}
I=< & X_{1,1} X_{2,2}-X_{1,2} X_{2,1}, \\
& X_{1,1} X_{3,2}-X_{1,2} X_{3,1} \\
& X_{2,1} X_{3,2}-X_{2,2} X_{3,1}>
\end{aligned} \\
& R=\mathbb{K}\left[X_{1,1}, X_{1,2}, \ldots, X_{3,2}\right] . \\
& H_{R / I}(t)=\sum_{d \in \mathbb{Z}^{+}} \operatorname{dim}_{\mathbb{K}}[R / I]_{d} \cdot t^{d}=1+6 t+18 t^{2}+40 t^{3}+\ldots \\
& \mathrm{H}_{R / I}(t)=\frac{1+2 t}{(1-t)^{4}} \\
& \mathcal{M}\left(\left(r_{1}, r_{2}\right),\{\{1\},\{2\}\}\right) \\
& H_{R_{\mathbf{r}} / I_{\mathbf{r}}}(t)=?
\end{aligned}
$$

## Running example

$$
\mathrm{H}_{R_{\mathbf{r}} / \mathrm{I}_{\mathbf{r}}}(t)=\frac{\sum_{i=0}^{r_{1}-1}\binom{r_{1}-1}{i}\binom{r_{2}-1}{i} t^{i}}{(1-t)^{r_{1}+r_{2}-1}}
$$

Conca-Herzog, 1994

There exists recursive formulas
but not closed formulas

What about more complicated models?

## equvariant Hilbert series

Fix $\Delta$ and consider $\mathscr{I}_{\Delta}=\left\{I_{\mathbf{r}}\right\}_{\mathbf{r} \in \mathbb{N}}^{m}$, where $I_{\mathbf{r}} \subset R_{\mathbf{r}}$ is the ideal for the model $\mathcal{M}(\mathbf{r}, \Delta)$. The equivariant Hilbert series for $\mathscr{I}_{\Delta}$ is the formal power series

$$
\operatorname{equivH}_{\mathscr{I}_{\Delta}}(t, \mathbf{s})=\sum_{r_{i} \geq 1} H_{R_{\mathbf{r} / I \mathbf{r}}}(t) \mathbf{s}^{\mathbf{r}}
$$

$$
\text { Note: } \mathbf{s}^{\mathbf{r}}=s_{1}^{r_{1}} s_{2}^{r_{2}} \ldots s_{m}^{r_{m}}
$$

## Theorem (M-Nagel, 2018)

$\Delta=\{\{1\},\{2\}, \ldots,\{m\}\}$ induces $\mathscr{I}_{\Delta}=\left\{I_{\mathbf{r}}\right\}_{\mathbf{r} \in \mathbb{N}^{m}}$ with

$$
\text { equivH }_{\mathscr{I}_{\Delta}}\left(t, s_{1} \ldots s_{m}\right)=1+\frac{s_{1} s_{2} \ldots s_{m}}{\left(1-s_{1}\right)\left(1-s_{2}\right) \ldots\left(1-s_{m}\right)-t}
$$

$\stackrel{r_{1}}{r_{1}} \quad \stackrel{c}{\bullet} \quad$ equivH $\left(\mathrm{t}, \mathrm{s}_{1}\right)=\sum_{\mathrm{r}_{1} \geq 1}\left[\frac{1}{(1-\mathrm{t})^{\mathrm{cr}_{1}}}\right] \mathrm{s}_{1}^{\mathrm{r}_{1}}=\frac{(1-\mathrm{t})^{\mathrm{c}}}{(1-\mathrm{t})^{\mathrm{c}}-\mathrm{s}}$

## Theorem (Nagel-Römer, 2015)

Let $\mathscr{I}=\left\{I_{n} \subset R_{n}\right\}_{n \in \mathbb{N}}$, where $R_{n}=\mathbb{K}\left[X_{i, j} \mid 1 \leq i \leq c, 1 \leq j \in n\right]$, is an Inc-invariant filtration of ideals. Then

$$
\operatorname{equivH}_{\mathscr{I}}(\mathrm{t}, \mathrm{~s})=\sum_{\mathrm{n} \geq 1} \mathrm{H}_{\mathrm{R}_{\mathrm{n}} / \mathrm{I}_{\mathrm{n}}}(\mathrm{t}) \cdot \mathrm{s}^{\mathrm{n}}
$$

is a rational function.

## Corollary

Let $\Delta$ be any simplicial complex and $\mathscr{I}_{\Delta}=\left\{I_{r}\right\}_{r \in \mathbb{N}}$ a family of ideals arising from $\mathcal{M}(\mathbf{r}, \Delta)$ where $\mathbf{r}$ has all but one component fixed. Then equivH $\mathscr{\mathscr { I }}_{\Delta}(\mathrm{t}, \mathrm{s})$ is rational.

$\operatorname{equivH}\left(t, s_{1}, s_{2}\right)=\sum_{r_{1}, r_{2} \geq 1}\left(\frac{1}{(1-t)^{r_{1} r_{2}}}\right) s_{1}^{r_{1}} s_{2}^{r_{2}}=$ no rational presentation

Set $T=\left\{t \in[m] \mid r_{t} \in \mathbb{N}\right\}$. Given $\Delta$ and the fixed values $\left\{r_{i}, i \notin T\right\}$, one considers the family of ideals $\mathscr{I}_{\Delta, \mathbf{r}_{[m \backslash \backslash}}=\left\{I_{\mathbf{r}_{T}}\right\}_{r_{t} \in \mathbb{N}}$.

Under what conditions on $\Delta$ and $T$ is equivH $\mathscr{\mathscr { A }}_{\Delta, \mathrm{r}_{[\mathrm{m}] \backslash \mathrm{T}}}(\mathrm{t}, \mathrm{s})$ rational?

## Theorem (M-Nagel, 2018)

The equivariant Hilbert series for $\mathscr{I}_{\Delta, \mathbf{r}_{[m] \backslash T}}$ is rational if
(1) $F_{i} \cap F_{j}=\emptyset$ for any $F_{i}, F_{j} \in \Delta$.
(2) $|F \cap T| \leq 1$ for any $F \in \Delta$.

## Sketch of the proof:

(1) Reduce the problem to $\Delta$ being a graph.
(2) Study $H_{\operatorname{im}\left(\phi_{\mathbf{r}}\right)}(t)$, where $\operatorname{im}\left(\phi_{\mathbf{r}}\right)$ is an algebra over $\mathbb{K}$ generated by $\phi_{\mathbf{r}}\left(x_{\mathbf{i}}\right)$, for all $\mathbf{i} \in\left[r_{1}\right] \times\left[r_{2}\right] \times \cdots \times\left[r_{m}\right]$.
(3) Determine a regular language $\mathcal{L}$ and a weight function $\rho$ such that

$$
P_{\mathcal{L}, \rho}(t, \mathbf{s})=\text { equivH }_{\mathscr{I}_{\Delta, \mathbf{r}[\mathbf{m}] \backslash \mathrm{T}}}(\mathrm{t}, \mathbf{s})
$$

(1) Theorem [Honkala, 1989]: Let $\mathcal{L}$ be a regular language and let $\rho$ be a weight function on $\mathcal{L}$. Then the power series

$$
H_{\mathcal{L}, \rho}=\sum_{w \in \mathcal{L}} \rho(w)
$$

is a rational function.
