# Generalized Permutahedra

## Theorem [Aguilar/Ardila 2017]

Generalized permutahedra form a Hopf monoid.

## Definition

A **generalized permutahedron** is a polytope such that all of its edges have direction  $e_i - e_j$  for some  $i, j$ .

- Coproduct: [We will come back to this]

## Theorem [Aguilar/Ardila 2017]

The character group of permutahedra is isomorphic to power series under multiplication. For associahedra, it is isomorphic to power series under composition.

# Orbit Polytopes

## Definition

An **orbit polytope** has the form  $\text{conv}\{\sigma(p) : \sigma \in S_n\} =: \mathcal{O}(p)$  for some point  $p \in \mathbb{R}^n$ .

$\mathcal{O}(1, 1, 0)$

$\mathcal{O}_{2,1}$

$\mathcal{O}(1, 0, 0)$

$\mathcal{O}_{1,2}$

$\mathcal{O}(2, 1, 0)$

$\mathcal{O}_{1,1,1}$

# The Hopf Monoid of Orbit Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Mariel Supina

Hopf Monoids

Orbit  
Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

- Generated by orbit polytopes
- Product: standard product of polytopes
- Coproduct (for generalized permutahedra):
  - (i) Start with any  $S \subseteq [n]$
  - (ii) Find maximal face in direction  $e_S = \sum_{i \in S} e_i$
  - (iii) (nontrivial!!) That face decomposes as a product of a generalized permutahedron in  $\mathbb{R}^S$  and one in  $\mathbb{R}^{[n]-S}$
- **Hopf structure on orbit polytopes induces Hopf structure on compositions**

# Coproduct Example

$$n = 4, S = \{1, 3, 4\}, e_S = (1, 0, 1, 1)$$

$$\mathcal{O}(2, 2, 1, 0)$$

$$\mathcal{O}_{2,1,1}$$

$$(1, 0, 1, 1)$$

coproduct for  $S$

$$\mathbb{R}\{1,3,4\}$$

$$\mathcal{O}(2, 2, 1)$$

$$\mathcal{O}_{2,1}$$

$$\mathbb{R}\{2\}$$

$$\mathcal{O}(0)$$

$$\mathcal{O}_1$$

# Coproduct Example

$$n = 4, S = \{1, 3, 4\}, e_S = (1, 0, 1, 1)$$

We are “chopping” the composition  $(2, 1, 1)$ :

$$(2, 1 \dot{:} 1) \mapsto (2, 1) \otimes (1)$$

# Coproduct for Orbit Polytopes

Given a composition  $\alpha$ , what are all the possible outcomes of taking a coproduct?

The Hopf  
Monoid of

Hopf Monoids

Orbit  
Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

# Coproduct for Orbit Polytopes

Given a composition  $\alpha$ , what are all the possible outcomes of taking a coproduct?

## Definition

The **concatenation** of compositions  $\beta$  and  $\gamma$  is

$$\beta \cdot \gamma = (\beta_1, \dots, \beta_k, \gamma_1, \dots, \gamma_\ell).$$

The **near-concatenation** of  $\beta$  and  $\gamma$  is

$$\beta \odot \gamma = (\beta_1, \dots, \beta_k + \gamma_1, \dots, \gamma_\ell).$$

# Coproduct for Orbit Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Mariel Supina

Hopf Monoids

Orbit  
Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

Given a composition  $\alpha$ , what are all the possible outcomes of taking a coproduct?

## Definition

The **concatenation** of compositions  $\beta$  and  $\gamma$  is

$$\beta \cdot \gamma = (\beta_1, \dots, \beta_k, \gamma_1, \dots, \gamma_\ell).$$

The **near-concatenation** of  $\beta$  and  $\gamma$  is

$$\beta \odot \gamma = (\beta_1, \dots, \beta_k + \gamma_1, \dots, \gamma_\ell).$$

Since we can either “chop” in between parts or in the middle of a part, we will obtain a pair of compositions  $\beta$  and  $\gamma$  such that either  $\beta \cdot \gamma = \alpha$  or  $\beta \odot \gamma = \alpha$ .

Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

## Definition

The **character group** of a Hopf monoid is the collection of multiplicative functions from the Hopf monoid to a field  $\mathbb{k}$ , equipped with a convolution product  $*$ :

$$(\zeta * \psi)(x) = \sum_{S \subseteq [n]} \text{mult}_{\mathbb{k}} \circ (\zeta \otimes \psi) \circ \text{coproduct}_S(x)$$

Hopf Monoids

Orbit  
Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

## Theorem [S. 2019]

The character group of the Hopf monoid of orbit polytopes is isomorphic to the collection of generating functions of the form

$$\sum_{\beta \in \text{Comp}} \frac{c_{\beta}}{|\beta|!} R_{\beta}$$

under multiplication, where  $R_{\beta}$  is a collection of symbols indexed by compositions with the product

$$R_{\beta} R_{\gamma} = R_{\beta \cdot \gamma} + R_{\beta \odot \gamma}$$

and  $c_{\beta} \in \mathbb{k}$  with  $c_{\emptyset} = 1$  and  $c_{(n)} = c_{(1)}^n$  for all  $n$ .

# Connection to $NSym$

Monoid of  
Orbit  
Polytopes

Mariel Supina

Hopf Monoids

Orbit  
Polytopes

The Hopf  
Monoid of  
Orbit  
Polytopes

Character  
Group of Orbit  
Polytopes

- $NSym$ : Hopf algebra of noncommutative symmetric functions
- One basis of  $NSym$  is the **ribbon basis**  $\{R_\beta\}$  indexed by compositions, with  $R_\beta R_\gamma = R_{\beta \cdot \gamma} + R_{\beta \odot \gamma}$

## Alternate formulation of the theorem [S. 2019]

The character group of the Hopf monoid of orbit polytopes is isomorphic to a subgroup of the group of invertible elements in the completion of  $NSym$ .
